Jira Backlog – Checkout Funnel Optimization

1. Overview

Jira was used to convert business requirements into actionable development tasks. The backlog was structured using epics and user stories aligned with key problem areas identified in the checkout funnel analysis.

Each epic represents a major solution area, and user stories define specific features required to improve conversion rates and reduce drop-offs across the funnel.

---

2. Epics

The following epics were created to address key problem areas:

- Product Page Optimization
- Trust & Credibility
- Buy Now Flow
- Checkout Optimization
- Tracking & Analytics

---

3. Sample User Stories

Example 1:

Title: Add to Cart button visibility improvement

As a user
I want to clearly see the Add to Cart button
So that I can easily add products without confusion

Acceptance Criteria:

- Button visible above the fold
- High contrast colour
- Works on mobile and desktop

Example 2:

Title: Enable Buy Now option

As a user
I want a Buy Now option
So that I can directly proceed to checkout

Acceptance Criteria:

- Buy Now button visible on product page
- Positioned near Add to Cart
- Functional across devices

Example 3:

Title: Simplify checkout process

As a user
I want a simplified checkout flow
So that I can complete my purchase quickly

Acceptance Criteria:

- Checkout limited to 3 steps
- Clear progress indicator
- No unnecessary fields

---

4. **Jira Workflow**

The workflow followed in Jira includes:

- To Do → Tasks yet to be started
- In Progress → Tasks currently being worked on
- Done → Completed tasks

Each story was assigned a priority (High/Medium) based on business impact and expected improvement in conversion rates.

---
